ENGINEERING DESIGN HANDBOOK

Figures 1 and 2 show projections of a phase diagram. In the pressure-temperature phase diagram (Fig. 1) the boiling separates the gas and liquid region and ends in the critical point, where the liquid and gas phases disappear to become a single supercritical phase. This can be observed in the density-pressure phase diagram for carbon dioxide, as shown in Figure 2.

Supercritical fluid - Wikipedia

Water is the chemical substance with chemical formula H₂O; one molecule of water has two hydrogen atoms covalently bonded to a single oxygen atom. Water is a tasteless, odorless liquid at ambient temperature and pressure, and appears colorless in small quantities, although it has its own intrinsic very light blue hue. Ice also appears colorless, and water vapor is essentially invisible as a gas.

95 In TLC, the stationary phase is typically alumina ($\text{Al}_2\text{O}_3 \cdot x\text{H}_2\text{O}$) or silica gel ($\text{SiO}_2 \cdot x\text{H}_2\text{O}$). The covalent network of these absorbents create very polar materials.
